pull-down share (its mismatch divided by the inverter gain): < 1 % in both
lower branch for comparison: σ = 22.6 mV, all from the pull-down
skewed inverter
(nMOS 2.0/0.15, pMOS 0.42/4)
inverter nMOS
98 %
σ = 11.0 mV predicted, 10.6 mV Monte Carlo; gain 22.6
minimum inverter
(0.42/0.15 both)
inverter nMOS
55 %
inverter pMOS
45 %
σ = 17.6 mV predicted, 17.7 mV Monte Carlo; gain 16.2
